

Business Rules

Project Information and Requirements

• BR-001 — Business Objective Required

Every project must contain a clearly defined business objective before project planning may begin.

Required information should explain:

- Why the project is needed.
 - What business problem or opportunity it addresses.
 - What result the organization expects from the project.
-

• BR-002 — Project Description Required

Every project must contain sufficient information describing what the organization intends to build, change, improve, implement, or deliver.

The description should provide enough context for:

- Requirement analysis.
 - Project-type classification.
 - Project-size classification.
 - Task generation.
 - Required-role identification.
-

• BR-003 — Start Date Required

Every project must have a defined start date.

The start date acts as the initial reference point for:

- Task scheduling.
 - Dependency sequencing.
 - Employee assignment.
 - Estimated project completion date.
-

• BR-004 — System-Calculated Completion Date

The planned project completion date must be calculated by the planning system.

The calculation should consider:

- Generated project tasks.
- Task complexity.
- Task duration.
- Task dependencies.
- Parallel work.
- Company working days.
- Employee availability.

The user is not required to provide a target end date.

• **BR-005 — Requirement Identification**

Project information should be separated into appropriate requirement types where applicable.

Requirement types may include:

- Functional requirements.
 - Non-functional requirements.
 - Business constraints.
 - Requested features.
 - Integration requirements.
 - Data requirements.
 - User-role requirements.
-

• **BR-006 — Requirement Clarification**

A requirement that is too ambiguous or incomplete to support reliable project planning must be marked for clarification.

Clarification is required when the missing information materially affects:

- Project classification.
 - Task generation.
 - Required roles.
 - Dependencies.
 - Task complexity.
 - Project feasibility.
-

• **BR-007 — Requirement Priority**

Project requirements may be assigned one of the following priorities:

- Critical
- High
- Medium
- Low

Priority should be used when determining:

- Mandatory project work.
- Task importance.
- Critical project functions.
- Planning recommendations.

• **BR-008 — Mandatory Requirement Protection**

Requirements identified as mandatory must not be automatically removed from the generated project plan.

Mandatory requirements may include:

- Critical business requirements.
- Legal requirements.
- Company-policy requirements.
- Contractual requirements.
- Mandatory operational requirements.

• **BR-009 — Scope Definition**

The generated project plan must reflect the project scope identified from the user's requirements.

The project scope should identify:

- Major functions to be delivered.
- Relevant systems or platforms.
- Major integrations.
- Major user groups.
- Important exclusions where they are known.

• **BR-010 — Requirement-to-Task Traceability**

Every identified requirement requiring implementation must be linked to at least one generated task.

A requirement must not be treated as implemented when no project task addresses it.

Project Classification

• BR-011 — Project Type Classification

Every project must be classified into the most relevant supported project type before project-specific phases and tasks are generated.

Classification should consider:

- Project description.
 - Requested features.
 - Platforms.
 - Data requirements.
 - Integrations.
 - User roles.
 - Expected output.
-

• BR-012 — Multiple Project Characteristics

A project may contain characteristics belonging to multiple project types.

When this occurs:

- One project type should be selected as the primary project type.
 - Relevant secondary project characteristics may also influence task generation.
 - Applicable task rules from secondary characteristics may be included where required.
-

Small Project Classification

• BR-013 — Small Project

A project should be classified as **Small** when most of the following characteristics apply:

- The business scope is limited and clearly defined.
- The project contains approximately 1–3 major features or functional areas.
- Few or no external integrations are required.
- Only a small number of user roles are involved.
- Dependencies between major components are limited.
- The solution primarily targets one platform.
- Technical complexity is low.
- Organizational coordination is limited.
- Few specialist roles are required.

Classification result:

Small Project

Medium Project Classification

• BR-014 — Medium Project

A project should be classified as **Medium** when most of the following characteristics apply:

- The project has moderate business scope.
- Approximately 4–8 major features or functional areas are required.
- One or more external integrations are involved.
- Multiple user roles or business processes exist.
- Several project components depend on each other.
- Multiple technical roles are required.
- Multiple modules may exist within the same solution.
- Moderate technical coordination is required.
- Moderate organizational complexity exists.

Classification result:

Medium Project

Large Project Classification

• BR-015 — Large Project

A project should be classified as **Large** when most of the following characteristics apply:

- The project has broad or organization-wide scope.
- More than approximately 8 major features or functional areas are required.
- Multiple external systems, APIs, services, or platforms are involved.
- Many user roles or business processes exist.
- Complex dependencies exist between major components.
- Multiple specialist roles or technical teams are required.
- Multiple applications, platforms, or major subsystems may be involved.
- Technical complexity is high.
- Organizational coordination is significant.

Classification result:

Large Project

• BR-016 — Overall Project Classification

Project size must not be determined from a single characteristic.

The system should compare the overall project context against the Small, Medium, and Large classification rules before determining the final classification.

Final classification must be one of:

- Small
 - Medium
 - Large
-

Project Phase Generation

• **BR-017 — Requirement Analysis Phase**

Every project must contain a Requirement Analysis or equivalent initial phase.

This phase should establish:

- Business objective.
 - Functional requirements.
 - Non-functional requirements.
 - Major constraints.
 - Major stakeholders.
 - Project scope.
-

• **BR-018 — Design Phase**

A Design phase should be generated when the project requires one or more of the following:

- System architecture.
 - Application design.
 - User-interface design.
 - Database design.
 - Process design.
 - Technical solution design.
-

• **BR-019 — Implementation Phase**

Projects that create, configure, or modify a system must contain one or more Implementation or Development phases.

- **BR-020 — Integration Phase**

An Integration phase or integration tasks must be generated when the project involves:

- External APIs.
 - Third-party systems.
 - Multiple internal modules.
 - External services.
 - Data exchange between systems.
 - Interconnected applications.
-

- **BR-021 — Testing Phase**

Software-related projects must contain an appropriate Testing or Validation phase before final delivery or deployment.

- **BR-022 — Deployment Phase**

A Deployment phase must be generated when the project requires the completed solution to be released into an operational environment.

- **BR-023 — Handover Phase**

A Handover or Delivery phase should be generated when responsibility for the completed system must be transferred to:

- Users.
 - Operations staff.
 - Another company department.
 - A client.
 - A support team.
-

Project-Type Rules

- **BR-024 — Web Application Project**

A project should be classified as a **Web Application Project** when its primary deliverable is an application accessed through a web browser.

Common characteristics include:

- Browser-based interface.

- Frontend application.
- Backend services where applicable.
- Database functionality where applicable.
- Web-based authentication.
- External service integrations where applicable.

Recommended phases:

1. Requirement Analysis
2. System / Architecture Design
3. UI/UX Design where applicable
4. Frontend Development
5. Backend Development where applicable
6. Database Development where applicable
7. Integration
8. Testing
9. Deployment
10. Handover

• **BR-025 — Mobile Application Project**

A project should be classified as a **Mobile Application Project** when its primary deliverable is an application intended to run on mobile devices.

Common characteristics include:

- Mobile user interface.
- Android or iOS application.
- Backend/API integration where applicable.
- Mobile-specific functionality.
- Application distribution requirements.

Recommended phases:

1. Requirement Analysis
2. Application Design
3. UI/UX Design
4. Mobile Development
5. Backend / API Development where applicable
6. Integration
7. Testing
8. Release Preparation
9. Deployment / Distribution
10. Handover

• **BR-026 — Machine Learning Project**

A project should be classified as a **Machine Learning Project** when its primary deliverable depends on training, evaluating, or integrating a machine-learning model.

Common characteristics include:

- Dataset preparation.
- Feature preparation.
- Model development.
- Model evaluation.
- Prediction or classification functionality.
- System integration where applicable.

Recommended phases:

1. Requirement Analysis
2. Data Collection
3. Data Preparation
4. Exploratory Analysis where applicable
5. Model Development
6. Model Evaluation
7. System Integration where applicable
8. Testing
9. Deployment
10. Handover

• **BR-027 — Internal Business System Project**

A project should be classified as an **Internal Business System Project** when its primary purpose is supporting internal organizational processes.

Common characteristics include:

- Internal staff users.
- Business-process automation.
- Internal workflow management.
- Administrative functions.
- Organizational data management.

Recommended phases:

1. Business Process Analysis
2. Requirement Analysis
3. System Design
4. Development or Configuration
5. Data / System Integration where applicable
6. Testing
7. User Validation

- 8. Deployment
 - 9. Handover
-

Feature-to-Task Rules

- **BR-028 — Feature Task Generation**

Every major feature identified from project requirements must generate the tasks necessary to implement that feature.

- **BR-029 — Authentication Feature**

When a project requires user authentication, the project plan should include appropriate tasks for:

- Authentication design.
 - Login functionality.
 - Session or access handling where applicable.
 - Authentication testing.
-

- **BR-030 — Database Requirement**

When a project requires persistent data storage, appropriate tasks should be generated for:

- Database design.
 - Data structure definition.
 - Database implementation or configuration.
 - Data-access integration where applicable.
-

- **BR-031 — External Integration**

When a requirement depends on an external API, system, platform, or third-party service, the project plan should include:

- Integration implementation.
 - Integration configuration where required.
 - Integration validation.
 - Integration testing.
-

- **BR-032 — User Interface Requirement**

When a project includes a user-facing interface, appropriate tasks should be generated for:

- Interface design.
 - Frontend implementation.
 - User interaction.
 - Interface testing.
-

• **BR-033 — Administrative Functionality**

When a project includes administrative functionality, appropriate tasks should be generated for:

- Administrative interface.
 - Administrative functions.
 - Role/access behaviour where applicable.
 - Administrative workflow testing.
-

• **BR-034 — Duplicate Task Consolidation**

Tasks generated from different requirements should be consolidated when they represent equivalent implementation work.

Task Complexity and Duration

• **BR-035 — Simple Task**

A task should be classified as **Simple** when most of the following conditions apply:

- The scope is limited.
- It affects one primary component.
- It has few or no dependencies.
- It uses standard implementation techniques.
- Little or no external integration is required.
- Limited specialist knowledge is required.

Recommended duration:

1-3 working days

• **BR-036 — Medium Task**

A task should be classified as **Medium** when most of the following conditions apply:

- The task has moderate implementation scope.

- It affects multiple related components.
- One or more dependencies exist.
- External API or system integration may be required.
- Moderate testing is required.
- Coordination with another role or component may be necessary.

Recommended duration:

4–7 working days

• BR-037 — Complex Task

A task should be classified as **Complex** when most of the following conditions apply:

- The task has broad implementation scope.
- Multiple major components are affected.
- Significant business or technical logic is involved.
- Multiple dependencies exist.
- Complex integration may be required.
- Specialist knowledge may be required.
- Delay may significantly affect dependent tasks.

Recommended duration:

8–15 working days

• BR-038 — Task Complexity Classification

Every generated implementation task must be classified as:

- Simple
- Medium
- Complex

Task classification should consider:

- Scope.
 - Dependencies.
 - Integration complexity.
 - Technical difficulty.
 - Required coordination.
 - Specialist knowledge.
-

• BR-039 — Duration Selection

The selected duration within the applicable complexity range should consider:

- Task scope.
 - Project size.
 - Number of dependencies.
 - Integration difficulty.
 - Implementation difficulty.
 - Required specialist knowledge.
-

• **BR-040 — Working Days**

Project timeline calculations must use configured company working days rather than assuming all calendar days are working days.

• **BR-041 — Dependency Identification**

Dependencies affecting task execution must be identified before the final project timeline is calculated.

• **BR-042 — Parallel Work**

Tasks without blocking dependencies may run in parallel when suitable employees are available.

• **BR-043 — Completion-Date Calculation**

The final completion date must account for:

- Project start date.
- Task duration.
- Sequential dependencies.
- Parallel work.
- Company working days.
- Staffing feasibility.
